

# Treatment Information Sheet

## How Roof Shield Works

The treatment is designed to clean the roof slowly without causing any damage to the roofs surface. Reducing the risk of leaks by allowing water to flow freely down the roof. Following the application of the treatment solution, moss & lichen growth will begin the dying-off process straight away. The unsightly growth will begin to break away in sections or clumps with the help of the wind and rain. The treatment will not give you an instant clean.

## How long does it take to apply?

The application of the treatment can take anywhere between 10-30 minutes to apply, depending on the size and pitch of your roof.

## When will I see results?

Because roof treatment are gentle, they are slow acting.

## Here is our guideline of what to expect on a roof that has new growth:

Dying off process - Growth changes colour  
Roots & spores die off - Growth loosens  
Break away process - Growth breaks away in sections & clumps.

3-6 Months (9 months for established growth)  
6-9 Months  
12-18 Months

It's recommended to treat your roof every 2-3 years to protect the surface against organic growth. Some roofs with heavy or stubborn growth may require a booster treatment after 9 months to speed up the process and help to reach any trapped spores. At times the unsightly mould growth can cause staining to your roof.

## Is it safe to collect water from my roof?

If your are on tank water please notify us immediately!  
All pipes running from the roof to your water tank system must be disconnected before the treatment is applied and it is your responsibility to do so.

Following the treatment, you MUST wait a minimum of 3 very decent down pours of rain at the property before reconnecting your tank water system.
